

Super Bowl Ads from 2000 to 2020

By Samuel Posey (<https://github.com/PozieSwagger/lis4693-final-project>)

Introduction

Super Bowl has been an American culture sport for many years, where companies spend large sums of money for few second ads that would be displayed to millions of American. Throughout the years there has been no two similar ads throughout what was shown, and many companies go through great length to plan out elaborate ads that would drive more consumer to said company.

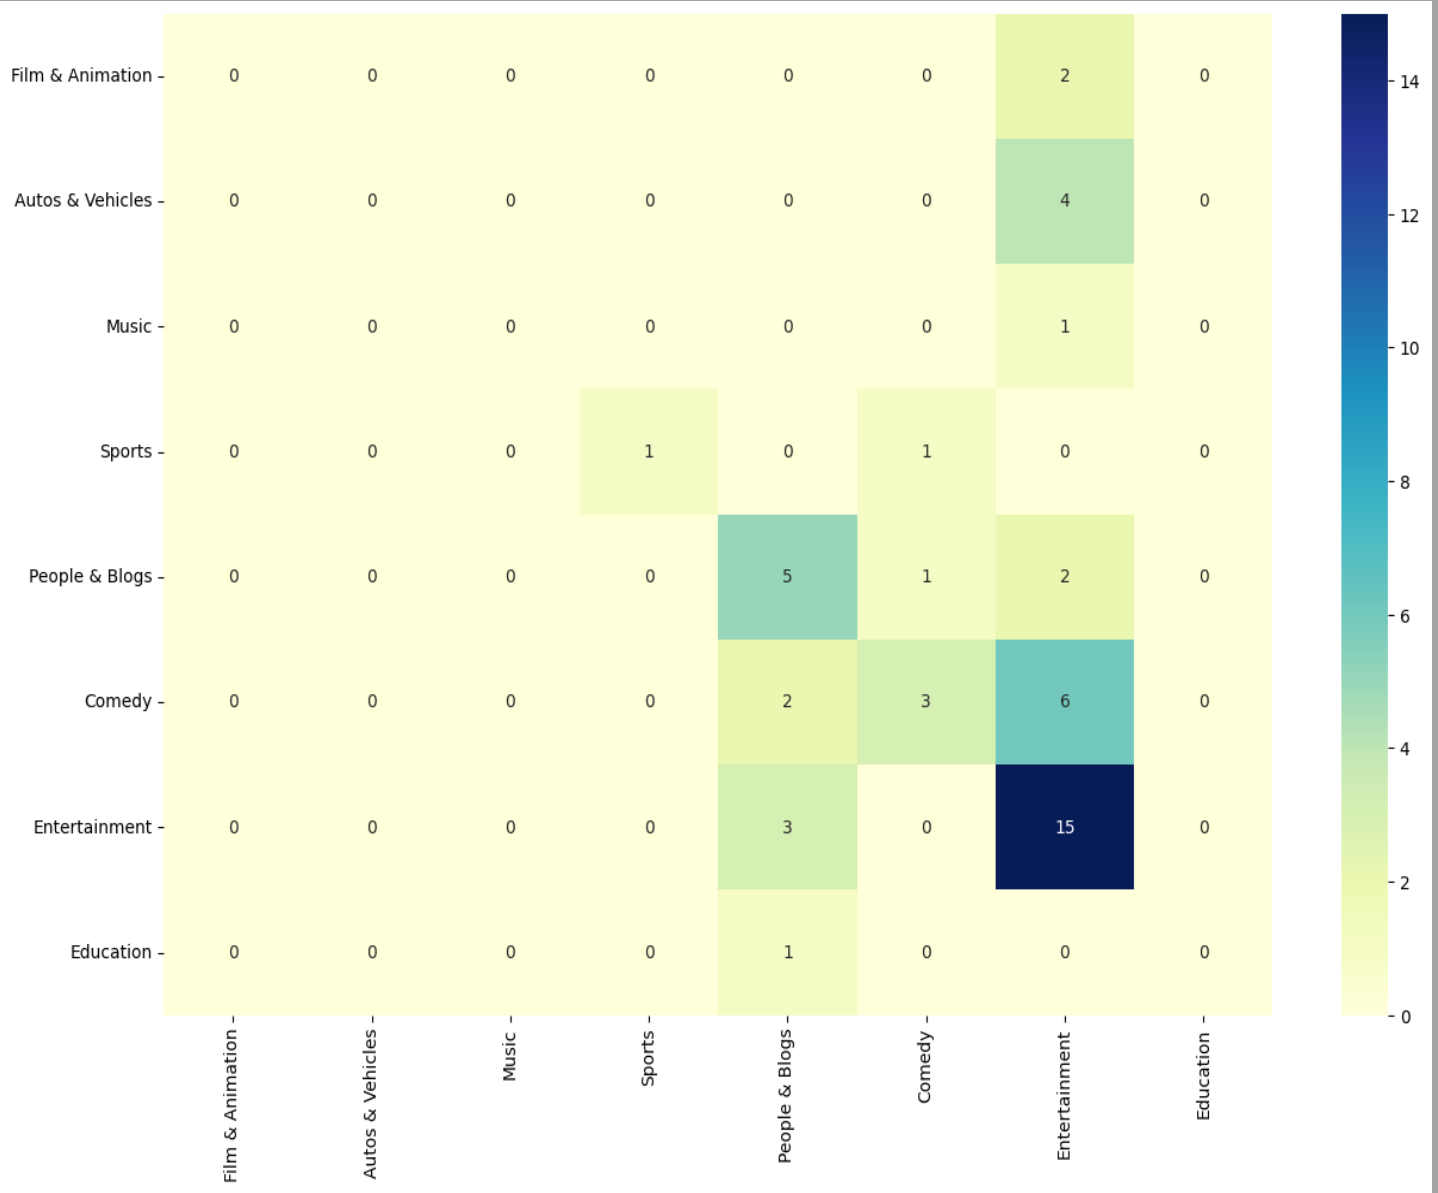

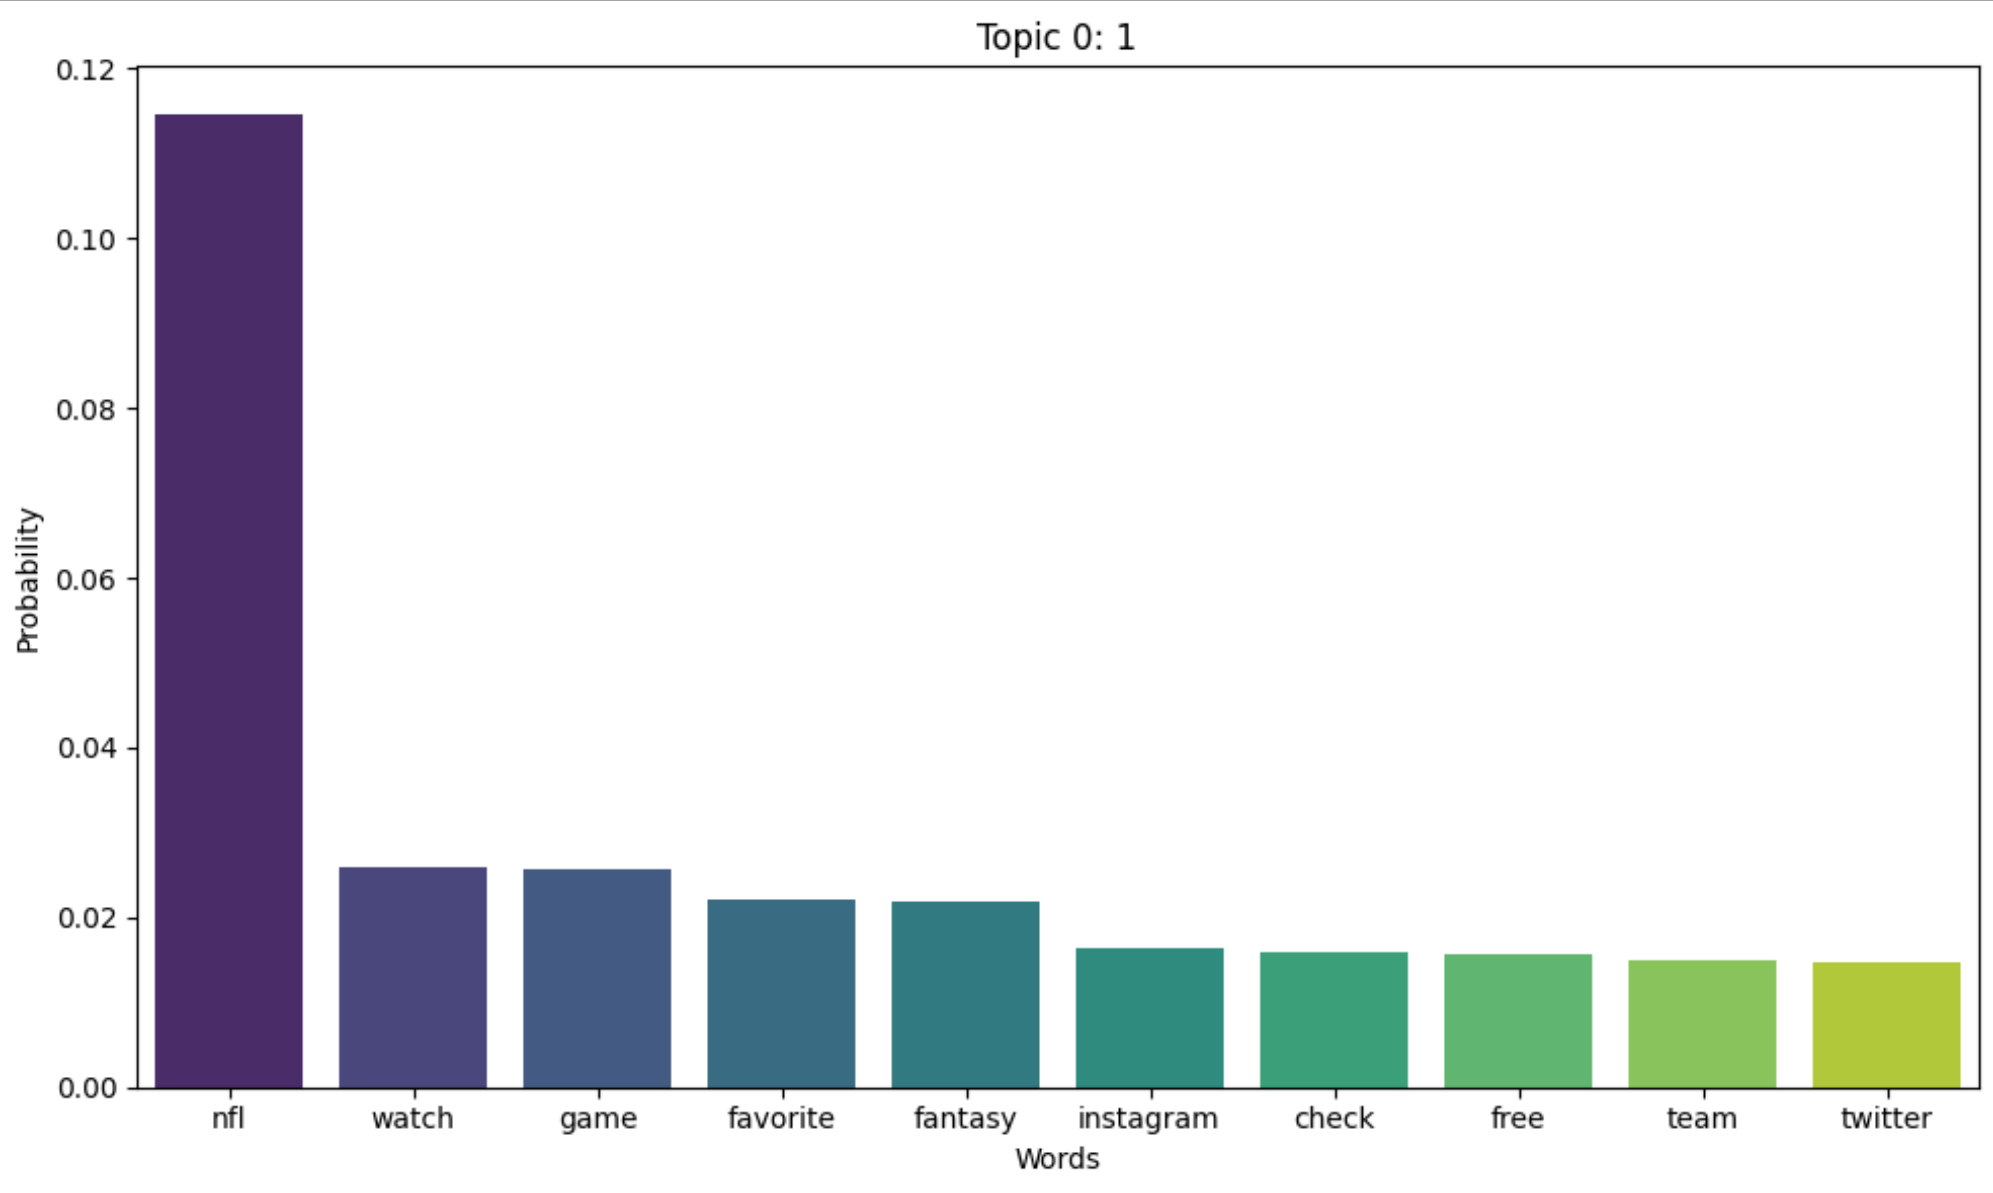

The goal is to look through the dataset of Super Bowl Ads that was collected from TidyTuesday, analysis and understand does the ads they collected give a clear picture of a trend throughout the years. Furthermore, does it give an understanding of what shifts happen through 2000 to 2020.

Data

- Collected from TidyTuesday GitHub repo
- Entry collected 249

Method

- Preprocess the downloaded csv from TidyTuesday
- Analysis dataset through topic modeling and sentimental analysis
- Run through a supervised machine learning models utilizing a Random forest classifier after completing and choosing between multiple other classifiers.

Finds

Trends of data tends to lean towards having the names of companies or famous celebrities from what is collected.

Furthermore, utilizing the descriptions and having a small set of data restrict the level of depth that machine learning and text analysis was able to do throughout the code.

Conclusion

Using the limited dataset has been a great limit of what could have been another wise great idea of watching a trend of ads through 2001 .com bauble and start of 2021 crypto boom. The collected data from using title or description did not prove to be very insightful when completing the analysis and machine learning.

For future cases, the utilization of AI to create a large dataset of collected information relating to what was shown through the commercials. Since, descriptions had limited of only including information of the company or who was shown in the commercials, use titles would have been far worse as those set of strings only have names of companies and it being a Super Bowl commercial.

Trend following through use of ads could be helpful in cases where more information relating to the content within the ads prove be needed.
